

**ScriptoriUM**

**Ready to mount directly**

– note, this example board is just for reference to show how the rails are constructed

## Board construction

– diagonally cut to create a floating feeling on the wall.

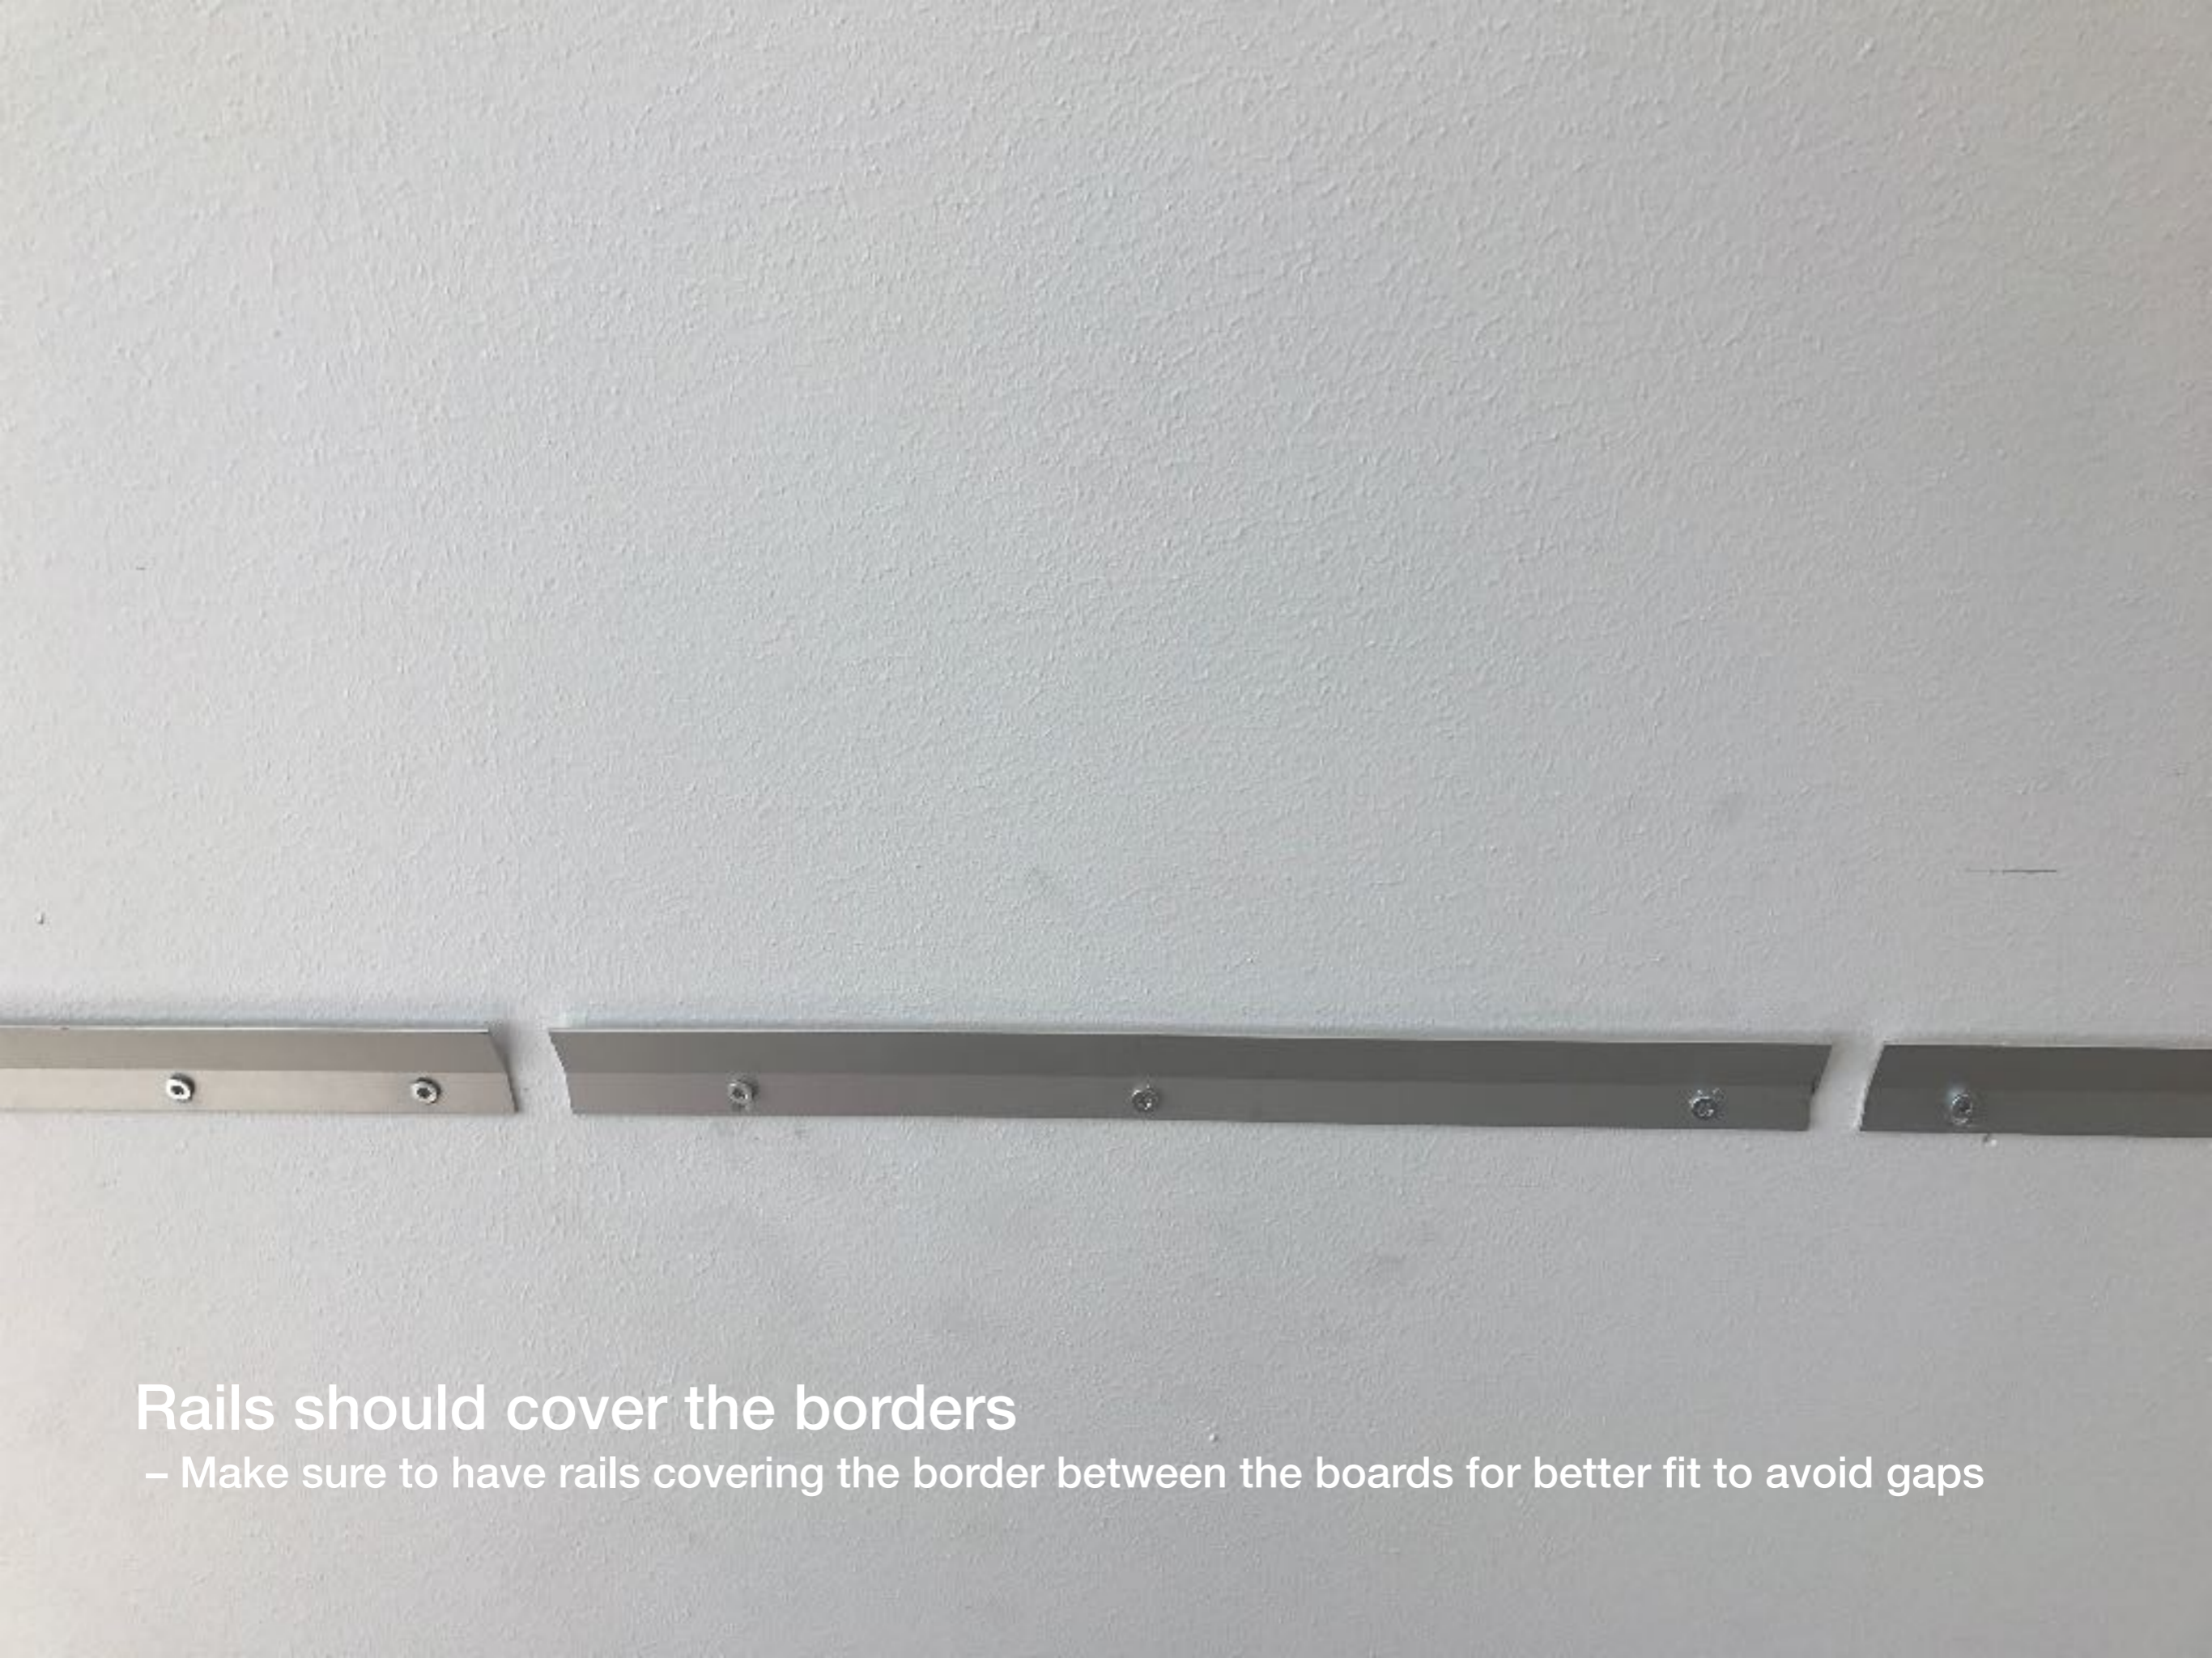

## Mount the rails

– note, make sure the wall is straight. If not, please adjust.

## Board on the wall

– can added one-by-one and slided left–right for fine tuning

## Rails should cover the borders

- Make sure to have rails covering the border between the boards for better fit to avoid gaps

## Concealed fittings

- The complete board comes in parts in sizes of 2 meters (smaller for edge blended systems)

**Slide boards next to each other**  
– Make sure they are tight together without gaps

## Add magnetic film

– Roll on top the magnetic film. Keep it straight and avoid bending.

## Remove the waist

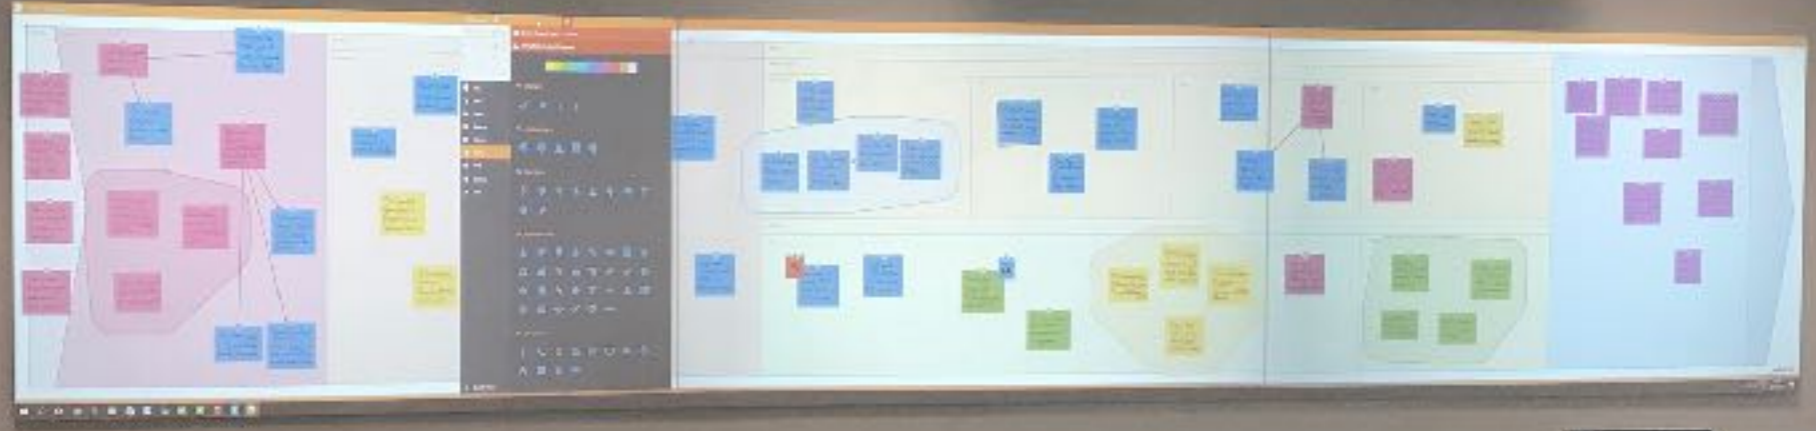

- The film is larger so use a sharp knife to remove the remaining film

## Wall ready

- The wall can now be dismantled and moved to a different location if needed

All done!
